

GPMS Maintenance Dashboard KPI Manual

KPI Number	KPI Name	Definition	Formula	Insight (Why?)
KPI 1	Current Open Work Orders	The total number of maintenance tasks that are not yet completed or closed.	Total number of work orders with status not marked as completed or closed.	Shows the current workload, helping managers allocate resources and identify potential delays.
KPI 2	Completed Work Orders for Week	The number of maintenance tasks finished during the current week.	Total number of work orders completed in the week.	Measures weekly productivity, indicating how efficiently the team is resolving tasks.
KPI 3	Work Orders In Progress	The number of maintenance tasks currently being worked on.	Total number of work orders with an 'In Progress' status.	Reflects active maintenance efforts, aiding in resource planning and workload management.
KPI 4	Total Work Orders (Filtered)	The total number of maintenance tasks within the selected filters (e.g., time period or location).	Total number of work orders in the filtered dataset.	Provides context for the scope of maintenance activities, helping assess overall activity levels.
KPI 5	Completed Work Orders (Filtered)	The number of maintenance tasks completed within the selected filters.	Total number of work orders marked as completed in the filtered dataset.	Indicates completion success within specific criteria, highlighting team performance.
KPI 6	Emergency Maintenance YTD	The number of unplanned breakdown repairs completed since the start of the year.	Total number of breakdown work orders completed year-to-date.	High emergency repairs suggest equipment reliability issues, prompting preventive actions.
KPI 7	Backlog Count YTD	The number of maintenance tasks overdue since the start of the current year.	Total number of open work orders past their due date in the current year.	Tracks delays, helping prioritize overdue tasks and improve scheduling.
KPI 8	Backlog Count Total	The total number of maintenance tasks overdue across all years.	Total number of open work orders past their due date.	Signals long-term inefficiencies, guiding process improvements to reduce backlog.
KPI 9	Projects In Progress	The number of ongoing major maintenance or improvement projects.	Total number of project-type work orders with an 'In Progress' status.	Tracks active projects, supporting resource allocation and project timeline management.
KPI 10	Total Projects YTD	The total number of major maintenance or improvement projects completed since the start of the year.	Total number of project-type work orders completed year-to-date.	Measures project activity, reflecting progress on strategic initiatives.
KPI 11	Planned Maintenance Percentage (PMP)	The percentage of maintenance hours spent on planned, proactive tasks (e.g., inspections, scheduled repairs).	$\frac{\text{(Total hours spent on planned maintenance)}}{\text{(Total maintenance hours)}} \times 100$	A high PMP (≥85%) indicates proactive maintenance, reducing downtime and costs.

KPI Number	KPI Name	Definition	Formula	Insight (Why?)
KPI 12	Corrective Maintenance Percentage	The percentage of maintenance hours spent on unplanned or breakdown repairs.	$\frac{\text{(Total hours spent on corrective maintenance)}}{\text{(Total maintenance hours)}} \times 100$	A high percentage suggests reactive maintenance, increasing costs and downtime.
KPI 13	Work Order Completion Rate	The percentage of maintenance tasks completed out of all tasks.	$\frac{\text{(Number of completed work orders)}}{\text{(Total number of work orders)}} \times 100$	A high rate (≥90%) reflects efficient operations and effective task management.
KPI 14	Work Orders by Location	The distribution of maintenance tasks across different facility locations.	Number of work orders per location.	Identifies high-maintenance areas, guiding resource allocation and facility inspections.
KPI 15	Work Orders by Priority	The distribution of maintenance tasks by urgency level (e.g., high, medium, low).	Number of work orders per priority level.	Highlights critical tasks, ensuring high-priority issues are addressed promptly.
KPI 16	Work Orders by Work Type	The percentage breakdown of maintenance tasks by type (e.g., planned, corrective, projects).	$\frac{\text{(Number of work orders per work type)}}{\text{(Total number of work orders)}} \times 100$	Shows the mix of maintenance activities, helping balance proactive vs. reactive work.
KPI 17	PMP vs. Corrective Maintenance	A comparison of hours spent on planned vs. corrective maintenance tasks.	Planned hours and corrective hours displayed as proportions of total hours.	Visualizes maintenance strategy; high corrective hours indicate reactive issues.
KPI 18	Monthly Work Order Trends	The number of total and completed work orders over the past six months.	Total and completed work orders per month.	Tracks trends, revealing seasonal patterns or process improvements.
KPI 19	Work Order On-Time Completion	The percentage of maintenance tasks completed by their due date.	$\frac{\text{(Number of on-time work orders)}}{\text{(Total completed work orders with due dates)}} \times 100$	High on-time rates (≥90%) indicate reliable scheduling and execution.
KPI 20	PM Compliance by Location	The percentage of planned maintenance tasks completed on time at each location.	$\frac{\text{(Number of on-time planned work orders per location)}}{\text{(Total planned work orders per location)}} \times 100$	Identifies compliance gaps by location, guiding targeted improvements.
KPI 21	Top 10 Work Types by Count	The ten most common types of maintenance tasks and their cumulative share.	Number of work orders per work type, with cumulative percentage.	Highlights dominant activities, aiding resource planning and optimization.
KPI 22	Top 10 Failure Types by Count	The ten most common reasons for equipment failures and their cumulative share.	Number of work orders per failure type, with cumulative percentage.	Identifies frequent failure modes, informing preventive strategies.
KPI 23	Top 10 System Types by Count	The ten most common equipment or system types requiring maintenance and their cumulative share.	Number of work orders per system type, with cumulative percentage.	Pinpoints high-maintenance systems, guiding reliability improvements.
